

Start with a buyer, not a guess.

January 2027. Two alternatives each use the same R300 opening cash and eight available owner hours. Do not spend that opening money twice. All prices, quantities, dates and hours are invented exercise inputs, not local recommendations.

Context illustration: ask about demand, units, quality, delivery and payment.

M-A / 2 January: a practice buyer asks about up to 40 kg at R12 per kg for 25 January, subject to quality and confirmation. This is an enquiry, not an accepted order or money received. The forecast assumes all 40 kg sell and payment arrives on 30 January.

M-B / 2 January: a practice buyer expresses interest in baskets at R30 each but confirms no quantity or order. The forecast assumes 20 items sell and payment arrives on 30 January. The work plan requires 10 owner hours in addition to the paid help below; only 8 owner hours are available.

Mark one documented fact, one assumption and one missing answer.

A kg and an item are different units. What can you compare across the two plans?

Can the earlier bills be paid?

Start each alternative with R300. A needs six owner hours. B needs ten, in addition to the paid helper. Only eight owner hours are available. No funding is approved. Quote cards below are future payments, not actual costs already paid.

Date	Plan A: produce	Plan B: baskets
05 January	A-P1: quoted purchase payment R180 on 5 January. No complete stock valuation is supplied.	B-P1: quoted material payment R280 on 5 January.
10 January	A-P2: quoted packaging payment R40 on 10 January.	B-P2: quoted paid help R140 on 10 January; it does not replace the specified owner hours.
20 January	A-P3: quoted transport payment R60 on 20 January.	B-P3: quoted delivery payment R60 on 20 January.
30 January	Assume 40 kg x R12 = R480 received.	Assume 20 items x R30 = R600 received.

After this event	A: cash	B: cash
Opening	R300.00	R300.00
5 January	R _____	R _____
10 January	R _____	R _____
20 January	R _____	R _____
30 January	R _____	R _____

Name the first unfunded payment and the deepest gap. Does the higher sales total settle this decision?

Delay: Move A's whole R480 receipt to 5 February. What is January closing cash? Does projected sales value change?

Funding: F-ASK is an R180 application with no approval or payment date. Can it fill B's gap? What else must be checked?

Keep plan and records apart.

These actual records are also invented. Begin with the same R300. The full cash scope has no other movements. Source ACT-C1 independently checks the closing balance. Full profit is not supplied.

Reference / date	Actual evidence
ACT-P1 / 01-05	ACT-P1: purchase payment R180 on 5 January.
ACT-P2 / 01-10	ACT-P2: packaging payment R50 on 10 January.
ACT-O1 / 01-15	ACT-O1: owner contributes R20 from outside the defined business cash scope on 15 January. This is neither a produce sale nor a loan.
ACT-P3 / 01-20	ACT-P3: transport payment R80 on 20 January.
ACT-S1 / 01-25	ACT-S1: dated delivery and invoice show 36 kg sold at R11 per kg, total R396. No opening customer balance, discount, return or credit adjustment applies.
ACT-R1 / 01-30	ACT-R1: R300 received on 30 January against ACT-S1; the invoice is not fully paid.
ACT-C1 / 01-31	ACT-C1: checked cash count plus statement evidence totals R310 on 31 January; all included accounts reconciled in the complete case.
ACT-R2 / 02-05	ACT-R2: remaining R96 received on 5 February against ACT-S1; outside the January cash window.

Find January sales, buyer receipts, payments, owner funds, closing cash and the amount still owed. Explain which February record stays outside January.

Why is the R20 not a sale? Why does the invoice plus two payments not mean three sales?

Explain the difference.

Keep the R500 original closing forecast. Show each adjustment to reach the checked actual R310. Use planned price for the quantity change, then actual quantity for the price change. This explains amounts, not why a buyer or grower acted.

Difference	Calculation / cash effect
Quantity	$(36 - 40) \text{ kg} \times R12 = R \text{_____}$
Price	$36 \text{ kg} \times (R11 - R12) = R \text{_____}$
January amount still owed	R _____
Purchase / packaging / transport changes	R _____ / R _____ / R _____
Owner contribution	R _____
Actual closing cash	R _____

Missing case: ACT-P2's amount and ACT-C1's closing reconciliation are unavailable. Which totals become unknown? Which sales and customer-balance figures remain supported?

Fresh items case: Plan ten items x R15, R60 payments, R80 opening. Actual eight items x R14; R90 received, R70 paid, R20 owner contribution. No other movements, adjustments or opening customer balances. Find actual sales, amount owed, closing cash and the difference from plan.

Explain the quantity and price effects in the fresh case. Does the cash difference prove a full profit or loss?

A plan someone can check.

Use a practice or redacted pack. Link each claim to evidence and mark actual, quoted, assumed or missing. A map, export or application does not establish title, full profit, compliance or funding approval.

Plan section	Evidence / status / next question

Buyer, units, quality and terms	
Site, resources and access	
Work, hours and delivery	
Costs, exclusions and source dates	
Dated cash and funding conditions	
Risk, trigger and feasible response	
Review date and responsible person	

Choose one original assumption, compare its actual evidence and propose a checked next action. Do not rewrite the original plan.

If a receipt is delayed or a cost is missing, what stops you committing now? What evidence would change that decision?

Practice review date: 10 February 2027. This is an exercise date, not a prescribed interval. Use the relevant actual operating cycle for a real plan.

App companions: [imbewufield.vercel.app/student/guides/mapping](#) and [/student/guides/charts](#). Retain separate part-payment schedules; the app's paid-in-full date does not supply instalment history.
