Producer's own cultivars: The same questionnaire confirms the nuts are grown on the producer's farm. Cultivar names are reproduced as written; spelling is not a taxonomy or catalogue change.

Prince Albert establishment and maturity expectation: An expectation for the newly established Platberg project, not a measured universal age curve. Its planted cultivars are Shufra, Ariyeh and Sirora; irrigated Karoo context retained.

Mirhi ya xisati yi tswala mihandzu ya swikamba swo tiya naswona yi lava mpova wa mirhi ya xinuna leyi faneleke. Xikombiso xa Prieska xi huma eka purasi ro oma ra Karoo leri cheletiwaka.

Xiphemu lexi dyiwaka ni ku tirhisiwa endhawini: The food is the tart leaf; flowers do not define leaf picking months.

Solitaire winter and pollen context: Solitaire is listed as self-compatible. Its chilling units are named-cultivar requirements and are not a numeric range for every apricot.

Irrigated Robertson trial context: The field experiment used managed organic orchards and found trade-offs in mulch effects; it does not justify a universal yield improvement from mulch.

Production at age six: The guide reports 4–6 kg/tree in year 6 and warns that yields are difficult to predict because of pollination and fruit set. The separate good result at year 8–9 is 9 t/ha. Do not connect them into a made-up growth curve or convert the later hectare result to arbitrary tree spacing.

Chilling and pollen partners: Conventional commercial cherry reference: more than 1,000 Positive Utah Chill Units, not 1,000 chill hours. Low-chill candidates need their own verified requirements. Most cultivars need compatible cross-pollination; the named self-fertile choices differ. The September flowering reference is not a picking-month array.

Observed Ceres season start: Ceres growers reported the start of the 2025 cherry harvest in late October, seven to ten days earlier than the prior year. This is an observed season in a named region, not a fixed future duration, KZN calendar or all-variety season.
